Points can be identified by ordered pairs, written  $(x, y)$ .

A line in slope-intercept form  $(y = mx + b)$  can be graphed by graphing the  $y$ -intercept first, and then following the slope to another point. Lines with positive slopes rise to the right; lines with negative slopes fall to the right.

Horizontal lines have the form  $y = b$  while vertical lines have the form  $x = a$ , where  $a$  is a constant.
